Track Roller Guidance Systems

Track roller guidance systems
Track rollers, bolts, guideways
Accessories

Issued: 2016, June

Foreword

Track roller guidance systems LF are highly suitable, due to their lightweight construction, for applications in handling systems where low-noise running, high speeds and long travel distances are required together with low, uniform displacement resistance.

Economical modular concept

In order to cover a wide range of requirements using standard components, the guidance systems are structured according to a modular concept. The system elements, namely carriages, composite guideways, track rollers and a precisely matched range of accessories can be combined to achieve designs that are precisely matched to the application.

Carriages

Carriages LF are supplied in the form of:

- economical, lightweight hollow section carriages
- robust open carriages for high performance guidance systems of a simple construction
- enclosed, compact carriages where guidance systems must operate in contaminated environments
- non-locating bearing carriages for locating and non-locating bearing applications with two guidance systems in a parallel arrangement
- bogie carriages for curved tracks or closed oval and circular guidance systems.

Guideways

Composite guideways are available as solid and hollow section guideways, with a support rail of high bending rigidity, as a half guideway, a curved guideway element or a flat design. Guideways with slots for toothed racks or toothed belts are also available.

Profiled track rollers

Profiled track rollers without filling slots are used to guide the carriages and support the forces. These double row angular contact ball bearings have an outer ring with a gothic arch profile raceway, are sealed on both sides and are greased for life. They can support axial loads from both sides and high radial forces due to the thick-walled outer ring.

Accessories

The spectrum of positive characteristics of our track roller guidance systems is completed by a comprehensive, precisely matched range of accessories for the system components.

Technical principles

Load carrying capacity and rating life

Permissible radial loads

The thick-walled outer rings of the track rollers can support high radial loads. If these track rollers are used against a shaft as a raceway, the outer rings undergo elastic deformation, *Figure 1*.

Compared to rolling bearings supported in a housing bore, track rollers have the following characteristics:

- modified load distribution in the bearing. This is taken into consideration by means of the basic load ratings $C_{r\,w}$ and $C_{0r\,w}$ used in the calculation of the rating life
- bending stress in the outer ring. This is taken into consideration by means of the permissible radial loads $F_{r\,per}$ and $F_{0r\,per}$. The bending stresses must not exceed the permissible strength values of the material (due to the risk of fracture).

Permissible radial load under dynamic loading

For rotating bearings under dynamic load, the effective dynamic load rating $C_{r\,w}$ is used. $C_{r\,w}$ is used to calculate the basic rating life.

The permissible dynamic radial load $F_{r\,per}$ must not be exceeded.

If the basic static load rating $C_{0r\,w}$ is lower than the basic dynamic load rating $C_{r\,w}$, $C_{0r\,w}$ is used.

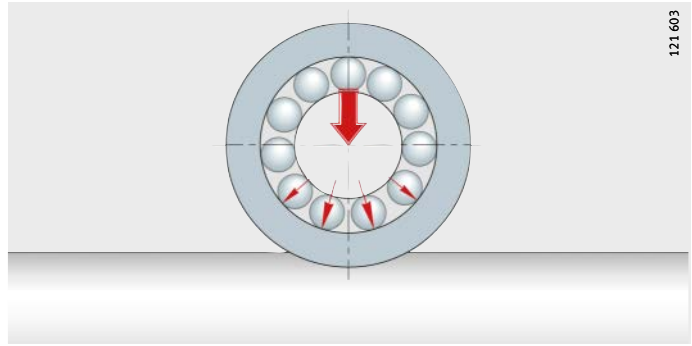

Figure 1
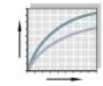
Deformation of the outer ring when used against a flat raceway



Permissible radial load under static loading

For bearings under static load, when stationary or with only infrequent motion, the effective static load rating $C_{0r\,w}$ is used. $C_{0r\,w}$ is used to calculate the static load safety factor S_0.

At the same time, the permissible static radial load $F_{0r\,per}$ must not be exceeded.

In addition to the permissible radial load of the bearing, the permissible radial load of the mating track must also be taken into consideration.

The basic load ratings stated are valid only in conjunction with a shaft as a mating track that is hardened (at least 670 HV) and ground (Ra 0,3).

Fatigue limit load

The fatigue limit load $C_{ur\,w}$ is defined as the load below which – under laboratory conditions – no fatigue occurs in the material.

Calculation of the rating life

The general methods for calculating the rating life are:

- the basic rating life in accordance with DIN ISO 281
- the adjusted rating life in accordance with DIN ISO 281
- the expanded calculation of the adjusted reference rating life in accordance with DIN ISO 281-4.

These methods are described in Catalogue HR 1, Rolling Bearings, in the chapter Load carrying capacity and rating life.

Load carrying capacity and rating life

Rating life of track rollers

In comparison with Catalogue HR 1, Rolling Bearings, the following values must be exchanged:

- $C_r = C_{rw}$
- $C_{0r} = C_{0rw}$
- $C_{ur} = C_{urw}$.

The carriages LFCL, LFL..-SF, LFLL, LFKL..-SF and bogie carriage LFDL contain four track rollers LFR.

The equivalent principle applies here. The corresponding parameters are taken into consideration in the basic load ratings C_y, C_{0y}, C_z, C_{0z} and the permissible moment ratings M_{0x}, M_{0y} and M_{0z}.

C_y N
Basic dynamic load rating in y direction

C_{0y} N
Basic static load rating in y direction

C_z N
Basic dynamic load rating in z direction

C_{0z} N
Basic static load rating in z direction

M_{0x} Nm
Static moment rating about x axis

M_{0y} Nm
Static moment rating about y axis

M_{0z} Nm
Static moment rating about z axis.

In the case of track rollers with a profiled outer ring, calculation is carried out exclusively by means of the basic rating life to DIN ISO 281.

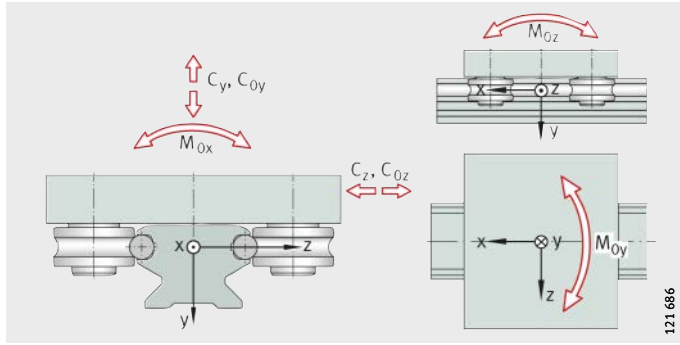


Figure 2
Load carrying capacity and load directions

Other formulae for calculating the basic rating life

$$L_s = 0{,}0314 \cdot D_a \cdot \left(\frac{C_{rw}}{P_r} \right)^p$$

$$L_h = 26{,}18 \cdot \frac{D_a}{H \cdot n_{osc}} \cdot \left(\frac{C_{rw}}{P_r} \right)^p$$

$$L_h = 52{,}36 \cdot \frac{D_a}{\bar{v}} \cdot \left(\frac{C_{rw}}{P_r} \right)^p$$

Rating life for carriages with four track rollers

$$L_s = \left(\frac{C_y, C_z}{P} \right)^p$$

$$L_h = \frac{833}{H \cdot n_{osc}} \cdot \left(\frac{C_y, C_z}{P} \right)^p$$

$$L_h = \frac{1\,666}{\bar{v}} \cdot \left(\frac{C_y, C_z}{P} \right)^p$$

L_s 10^5 m
Basic rating life in metres

D_a mm
Rolling contact diameter of track roller, see dimension tables

C_{rw}, C_y, C_z N
Effective dynamic load rating

P_r N
Equivalent dynamic load (radial load)

p –
Ball: p = 3;
needle roller (non-locating bearing track roller or carriage): p = 10/3

L_h h
Basic rating life in operating hours

H m
Single stroke length for reciprocating motion

n_{osc} min^{-1}
Number of return strokes per minute

$\bar{v}$ m/min
Mean travel velocity

P N.
Equivalent dynamic load in the corresponding load direction
(for applications with combined loads, please contact us).

Load carrying capacity and rating life

Operating life

The operating life is the life actually achieved by a rolling bearing. It may differ significantly from the calculated rating life.

This may be due to wear or fatigue as a result of:

- deviations in the operating data
- insufficient or excessive operating clearance (track roller, guideway)
- contamination
- inadequate lubrication
- operating temperature too high or too low
- reciprocating motion with very small stroke length, which can lead to false brinelling
- high vibration load, leading to false brinelling
- very high shock loads (static overloading)
- prior damage during mounting.

Due to the variety of mounting and operating conditions, the operating life cannot be precisely calculated in advance. The most reliable way of arriving at a close estimate is by comparison with similar applications.

Static load safety factor

The indicator of static loading is the static load safety factor S_0.

This indicates the security against impermissible permanent deformations in the bearing and is determined by means of the following equation:

$$S_0 = \frac{C_{0r\,w}}{F_{0r}}$$

Static load safety factor for carriages with four track rollers

$$S_0 = \frac{C_0}{F_0}$$

$$S_0 = \frac{M_0}{M}$$

S_0 –
Static load safety factor

$C_{0r\,w}$ N
Effective static load rating of track roller, see dimension tables

F_{0r} N
Static force acting in radial direction

C_0 N
Basic static load rating of carriage, see dimension tables

F_0 N
Static force acting in y and z direction

M_0 Nm
Permissible static moment in x, y, z direction

M Nm
Moment acting in load direction (M_x, M_y, M_z).

Track rollers are regarded as heavily loaded at a static load safety factor of $S_0 < 4$.

For applications with normal operating conditions, a value $S_0 > 4$ is required.

When using individual track rollers, for example in conjunction with guideways, the decisive factor where required is the permissible load of the guideway.

Static load safety factors $S_0 < 1$ cause plastic deformation of the rolling elements and the raceway, which can impair smooth running. This is only permissible for bearings with small rotary motions or in secondary applications.

Load carrying capacity and rating life

Minimum load

In order to ensure that the outer ring is driven, that no slippage occurs and that the track roller does not lift from the mating track, the track rollers must be subjected to a minimum load in dynamic operation.

In general, the minimum load is calculated using the ratio $C_{0r\,w}/F_r < 60$.

Differences in raceway hardness

If shafts with a lower surface hardness are used (such as X46, X90), a hardness factor must be applied, see equations and *Figure 3*.

$$C_H = f_H \cdot C$$

$$C_{0H} = f_{H0} \cdot C_0$$

C_H N
Effective dynamic load rating

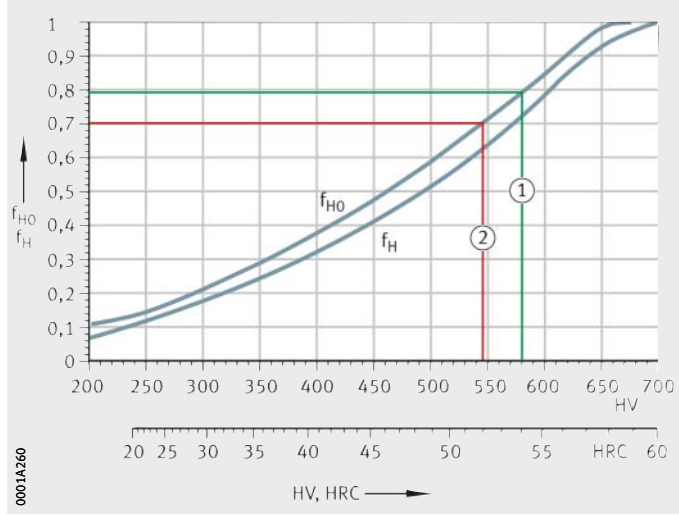
f_H –
Dynamic hardness factor

C N
Basic dynamic load rating

C_{0H} N
Effective static load rating

f_{H0} –
Static hardness factor

C_0 N
Basic static load rating.



f_{H0}, f_H = hardness factor
HV, HRC = surface hardness

① LFS..-RB, W..-X90
② W..-X46

Figure 3
Static and dynamic hardness factors for lower hardness of raceways

Lubrication

Lubrication of guideway raceways

The guideway raceways must be lubricated (even before first use). Lubrication can be carried out by means of lubrication and wiper units.

These units are already integrated in the compact carriage LFKL..-SF. For carriages LFL..-SF and LFCL, the lubrication and wiper unit AB, see page 109, is available as an accessory.

The guideway raceway is lubricated by an oil-soaked felt insert. Oil can be fed to the felt inserts via lubrication nipples in the end faces. At delivery, the felt inserts are already soaked with oil (H1 approval for the food industry), where relubrication is to be carried out an oil of viscosity $\nu = 460\ mm^2/s$ is recommended.

Lubrication intervals

The lubrication intervals for guideway raceways are dependent on the environmental influences. The cleaner the environment, the smaller the quantity of lubricant required. The time and quantity can only be determined precisely under operating conditions since it is not possible to determine all the influences by calculation. An observation period of adequate length must be allowed.

Fretting corrosion is a consequence of inadequate lubrication and is visible as a reddish discolouration of the mating track or outer ring. Inadequate lubrication can lead to permanent system damage and therefore to failure. It must be ensured that the lubrication intervals are reduced accordingly in order to prevent fretting corrosion.

In general, a thin film of oil should always be present on the shaft.

Lubrication of track rollers

At delivery, track rollers LFR have an initial greasing of a high quality lithium soap grease.

From LFR5204-16, the inner ring has a relubrication hole. Track rollers of smaller diameters are lubricated for life.

Lubrication

Further information on lubrication

Further information can be found in Catalogue HR 1, Rolling Bearings, in the chapter Lubrication.

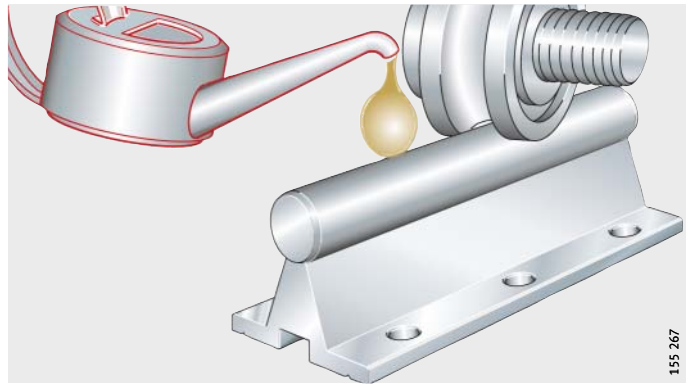


Figure 1
Lubrication of guideway raceways

Design of bearing arrangements

Requirements for the adjacent construction

The running accuracy of the linear guidance system is essentially dependent on the straightness, accuracy and rigidity of the mounting surfaces.

The higher the requirements for accuracy and smooth running of a track roller guidance system, the more attention must be paid to the geometrical and positional accuracy of the adjacent construction. The adjacent surfaces should be flat and have parallel faces.

For two guideways, we recommend a parallelism according to *Figure 1*.

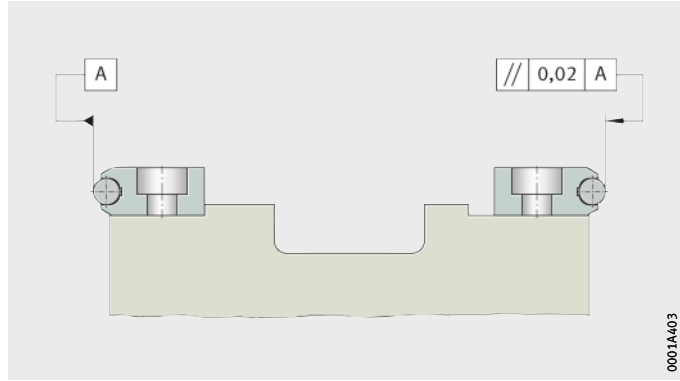

Figure 1
Parallelism of guideways

Shaft creep

Under unfavourable conditions, shaft creep of a few millimetres may occur in isolated cases. This creep may occur mainly in applications with high accelerations in conjunction with high alternating loads and guideways that are not completely supported. It may also be caused by an adjacent construction that is too soft.

In such cases, shaft creep can be prevented by the use of end plates ANS.LFS, see dimension table page 115. They can be supplied already mounted.

Displacement force

The displacement force is dependent on the preload, the lubrication and the particular application. It is therefore not possible to make generally valid statements.

Design of bearing arrangements

Location of carriages and guideways

If lateral loads are present, it is recommended that the guideways and carriages should be located against locating surfaces. In the case of guideways comprising multiple sections joined together, it is recommended that the guideways should be aligned by means of the shaft. If necessary, the shafts should be located on the adjacent construction by means of dowels.

If two guideways are arranged in parallel, the first guideway should be clamped against a stop, *Figure 1*, page 21. The second guideway should then be aligned accordingly. Any gaps between the guideway and the adjacent construction should be filled with synthetic resin.

Track roller guidance systems in accordance with customer specifications

The INA track roller guidance systems with curved guideway elements can be used to achieve an extremely wide variety of applications, *Figure 2* and *Figure 3*, page 23.

If the arrangement required cannot be represented using the standard ordering designation, a customer drawing must be submitted with the enquiry.

For arrangements with curved guideway elements, it is recommended that the guideway connectors VBS should be used at the joints, see page 114. This gives considerably easier mounting.

Standard oval tracks are always supplied with guideway connectors VBS, see page 102.

Mounting

Delivered condition

Carriages are delivered with the track rollers fitted. All the bolts are tightened to the required tightening torque.

Carriages

For carriages, this gives:

- hollow section carriage LFCL;
  clearance-free, with mounting of accessories as necessary
- compact carriage LFKL..-SF;
  clearance-free, with mounting of lubrication and wiper unit as necessary
- non-locating bearing carriage LFLL..-SF;
  clearance-free, with mounting of accessories as necessary
- open carriage LFL..-SF;
  clearance-free, with mounting of accessories as necessary
- bogie carriage LFDL..-SF (-B);
  LFDL..-SF clearance-free, with mounting of accessories as necessary. In the case of LFDL..-B, the clearance must be set by means of eccentrics.

Mounting of guidance system with one guideway

Mounting of guidance system with one guideway:

- Place the guideway on the adjacent construction and screw mount finger tight.
- Align the guideway; if necessary, clamp the shaft against the locating edge and screw mount firmly, observing the tightening torques.
- Clearance-free carriages: slide the carriage onto the guideway.
- Carriages with adjustable clearance: if lateral load is present, ensure that the principal load is supported by the concentric bolts.
- Position and screw mount the adjacent construction.

Mounting of guidance system with two guideways

Mounting of guidance system with two guideways:

- Position the first guideway, clamp it against the locating edge and tighten the screws.
- Position the second guideway and screw mount finger tight.
- Slide the carriage onto the guideway, set the clearance as necessary, *Figure 2*, page 28.
- Position the adjacent construction, align the carriage and screw mount firmly; observe the tightening torques M_A, see table, page 29.
- Align the second guideway with the aid of the table, move the table several times during this operation.
- Tighten the fixing screws in the guideway; tightening torques M_A, see table, page 29.

Where necessary, form fit can be achieved between the guideways and adjacent construction by means of synthetic resin or strips.

Mounting of curved guideway elements and oval tracks

Mounting of curved guideway elements and oval tracks:

- Assemble the curved guideway elements or oval tracks.
- Position the assembled elements precisely on the adjacent construction and fix in place by means of clamps.
- Transfer the hole pattern for the fixing holes to the adjacent construction.
- Remove the elements and make the fixing holes in the adjacent construction.
- Position the elements on the adjacent construction again and tighten the fixing screws; observe the tightening torques M_A, see table, page 29.

Mounting of bogie carriage

Slide the clearance-free carriage LFDL..-SF onto the guideway. No setting of clearance is required, *Figure 1*, page 28.

The bogie carriage LFDL..-SF cannot be mounted on closed ring systems, in this case use the clearance-free bogie carriage LFDL..-B.

Carriages with adjustable clearance

Slide the carriage LFDL..-B onto the guideway and set in position without load. Rotate the eccentric bolts using an open-end wrench or ring wrench so that the track rollers are set against the raceway, observing the direction of rotation, *Figure 2*, page 28.

Tighten the hexagon nuts to the tightening torque M_A; tightening torques, see table, page 29.

The track rollers must be easily movable and clearance-free. If they are set in place too firmly, this will generate preload that reduces the life of the guidance system.

Mounting

Inspection

Check the adjustment. The guidance system is correctly adjusted if, when the carriages are moved, all the track rollers rotate and the carriages can be moved easily.

The concentric bolts are tightened to the necessary tightening torque, the eccentric bolts are tightened finger tight. When setting the preload, these must be tightened to the tightening torque M_A, see table Tightening torques for track roller bolts, page 29.

Accuracy

Accuracy of guideways LFS

Data on the straightness, parallelism (differential measurement), length and positional tolerances of guideways are given in the following tables and figures, *Figure 1* to *Figure 5*, page 32.

The guideways are precision straightened and the tolerances are better than DIN EN 12020.

Length tolerance

Length L mm		Tolerance mm
Single-piece guideways	L < 1 000	±2
	1 000 ≦ L < 2 000	±3
	2 000 ≦ L < 4 000	±4
	4 000 ≦ L	±5

Ordering example, ordering designation

Ready-to-fit systems

The elements of the track roller guidance systems (such as the carriage, guideway) must be ordered separately.

Carriages should be regarded as a unit, including the track rollers and bolts.

Carriages and guideways can be used in any combination and can be ordered independently of each other.

Ordering example

Track roller guidance system of corrosion-resistant design with open carriage LFL52-E-SF, *Figure 1* and *Figure 2*.

Track roller, bolt, wiper

Operating limits

Operating temperature

Track roller guidance systems can be used at a temperature from –20 °C to +80 °C. For applications below –20 °C and above +80 °C, please contact us.

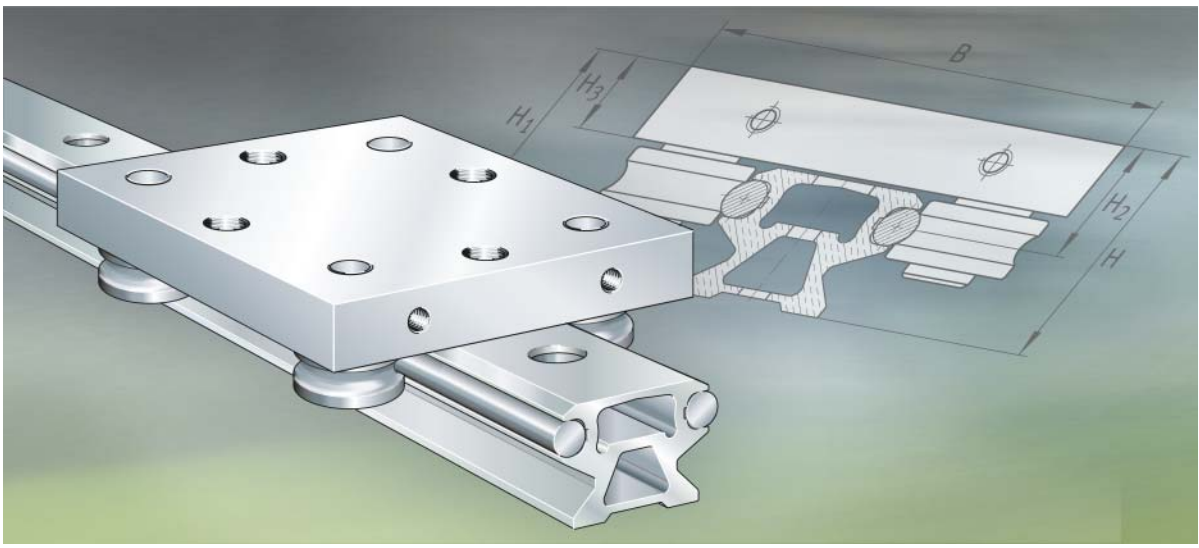
The area of application is restricted by the lubricant, the plastics used and the composite materials.

Velocities

The maximum possible speed of track roller guidance systems is 10 m/s. Higher speeds may be possible by agreement.

Acceleration

When using track roller guidance systems, accelerations of up to 50 m/s^2 can be achieved.



Track roller guidance systems

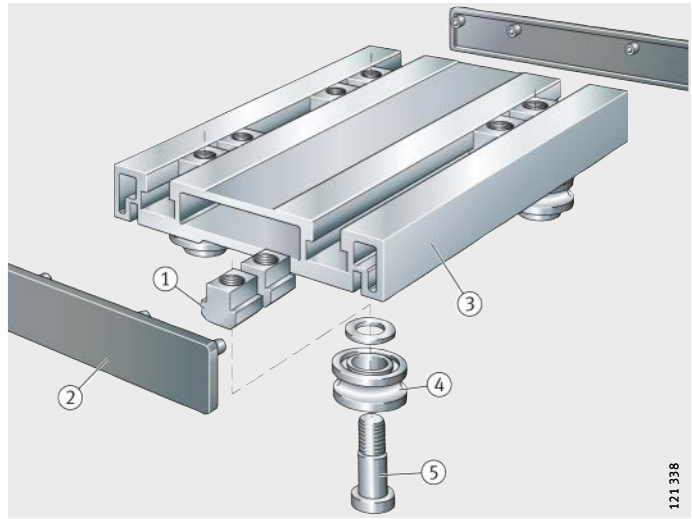
Features

Track roller guidance systems are available with a hollow section carriage, compact carriage, open carriage, non-locating bearing carriage or bogie carriage.

Track roller guidance system with hollow section carriage

The economical series LFCL is characterised in particular by its low mass and its high moment load carrying capacity M_x. In addition, more individual design of the adjacent construction is possible by means of four T-bolts that can be moved in a longitudinal direction.

A carriage comprises a carriage plate made from anodised aluminium, four concentric bolts, four track rollers, two end covers for the hollow sections and four T-nuts that can be used for the adjacent construction, *Figure 1*. The track rollers and end covers are already fitted.



① T-nut
② End cover
③ Carriage plate
④ Track roller
⑤ Concentric bolt

Figure 1
Hollow section carriage

Preload and clearance

The carriages run clearance-free on all INA guideways, see page 42, and can be combined with all guideways of the relevant size, but not with the curved guideway elements LFSR. Due to the highly accurate guideways, it is not necessary to set the clearance.

Sealing and lubrication

The track rollers have gap seals on both sides, are greased for life and are therefore maintenance-free.

The raceways can be lubricated using cap wipers AB.LFR. Their fixing screws pass into the screw mounting channels of the carriage plate.

Corrosion-resistant design

All steel parts, the inner and outer rings of the track rollers and the bolts, washers and nuts are made from corrosion-resistant steel. The rolling elements are protected against corrosion by the grease.

Corrosion-resistant designs have the suffix RB.

Further information

Further information is given on the following pages:

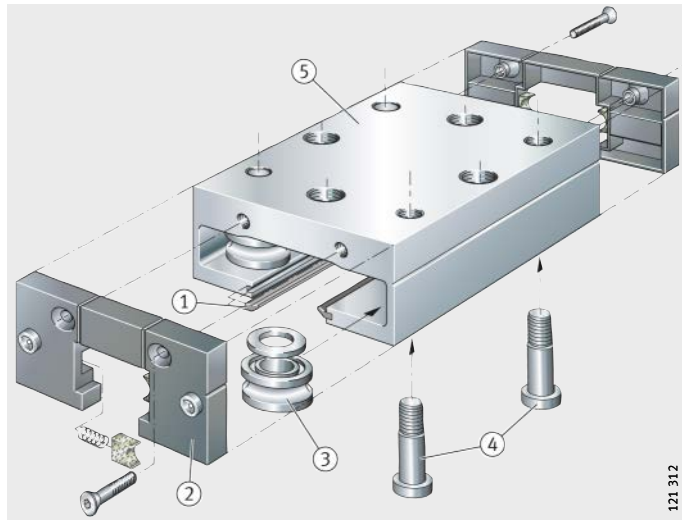
- dimension table, see page 56
- track rollers, see page 68
- guideways, see page 76
- accessories, see page 106.

Track roller guidance systems

Track roller guidance system with compact carriage

The closed compact carriage LFKL..-SF gives a simple means of achieving track roller guidance systems for operation in contaminated environments. The track rollers are protected against contamination by the closed design. It has two integrated lubrication units for lubrication of the raceways.

A carriage comprises a saddle plate made from anodised, profiled aluminium, four concentric bolts, four track rollers, two sealing strips and two lubrication and wiper units, *Figure 2*. The track rollers are already fitted, the sealing strips as well as the lubrication and wiper units are included loose in the delivery.

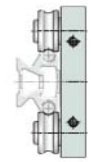


① Sealing strip
② Lubrication and wiper unit
③ Track roller
④ Concentric bolt
⑤ Saddle plate

Figure 2
Compact carriage

Preload and clearance

The carriages run clearance-free on all INA guideways, see page 42, and can be combined with all guideways of the relevant size, but not with the curved guideway elements LFSR. Due to the highly accurate guideways, it is not necessary to set the clearance.



Sealing and lubrication

The track rollers have gap seals on both sides, are greased for life and are therefore maintenance-free.

For lubrication of the raceways, the lubrication and wiper units have oil-soaked felt inserts that can be replenished with oil via lubrication nipples. In combination with the sealing strips (gap seals), these units protect the compact carriage on all sides against contamination.

Corrosion-resistant design

All steel parts, the inner and outer rings of the track rollers and the bolts, washers and nuts are made from corrosion-resistant steel. The rolling elements are protected against corrosion by the grease.

Corrosion-resistant designs have the suffix RB.

Further information

Further information is given on the following pages:

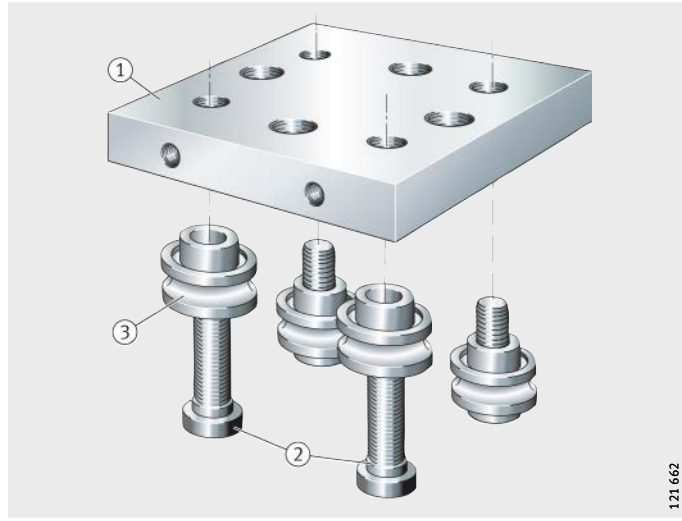
- dimension table, see page 58
- track rollers, see page 68
- guideways, see page 76
- accessories, see page 106.

Track roller guidance systems

Track roller guidance system with open carriage

The robust, open carriage LFL..-SF is suitable where high performance linear guidance systems of a simple construction are required.

A carriage comprises a carriage plate made from anodised aluminium, four screws and four track rollers, *Figure 3*. The track rollers are already fitted.



① Carriage plate
② Screws
③ Track roller

Figure 3
Open carriage

Preload and clearance

The carriages run clearance-free on all INA guideways, see page 42, and can be combined with all guideways of the relevant size, but not with the curved guideway elements LFSR. Due to the highly accurate guideways, it is not necessary to set the clearance.

Sealing and lubrication

The track rollers have gap seals on both sides, are greased for life and are therefore maintenance-free.

The raceways can be lubricated by means of lubrication and wiper units AB, see page 106. Their oil-soaked felt inserts can be replenished with oil via lubrication nipples. In combination with side plates ABAL, these units seal the end faces and longitudinal sides of the open carriage, see page 107.

Corrosion-resistant design

All steel parts, the inner and outer rings of the track rollers and the screws, washers and nuts are made from corrosion-resistant steel. The rolling elements are protected against corrosion by the grease.

Corrosion-resistant designs have the suffix RB.

Further information

Further information is given on the following pages:

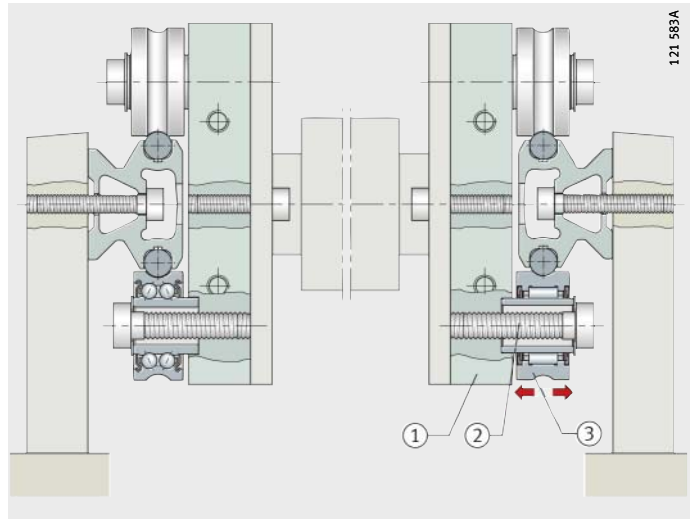
- dimension table, see page 60
- track rollers, see page 68
- guideways, see page 76
- accessories, see page 106.

Track roller guidance systems

Track roller guidance system with non-locating bearing carriage

Non-locating bearing carriages LFLL..-SF are robust, ready-to-fit linear guidance systems that are used exclusively in locating or non-locating bearing applications with two parallel guideway systems. The track rollers can be axially displaced. In this way, it is possible to compensate inaccuracies of ±1 mm in relation to the spacing of the guideways.

A carriage comprises a carriage plate made from anodised aluminium, four screws and four non-locating bearing track rollers, *Figure 4*. The track rollers are already fitted.

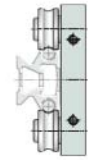


① Carriage plate
② Screw
③ Non-locating bearing track roller

Figure 4
Non-locating bearing carriage

Preload and clearance

The carriages run clearance-free on all INA guideways, see page 42, and can be combined with all guideways of the relevant size, but not with the curved guideway elements LFSR. Due to the highly accurate guideways, it is not necessary to set the clearance.



Sealing and lubrication

The track rollers have gap seals on both sides, are greased for life and are therefore maintenance-free.

The contact zone between the raceways and track rollers must be lubricated via the shaft.

Corrosion-resistant design

All steel parts, the inner and outer rings of the track rollers and the screws, washers and nuts are made from corrosion-resistant steel.

The rolling elements are protected against corrosion by the grease.

Corrosion-resistant designs have the suffix RB (available by agreement only).

Non-locating bearing carriages must never be used on their own but only ever in combination with locating bearing carriages.

The track rollers can support loads in a radial direction only.

Further information

Further information is given on the following pages:

- dimension table, see page 62
- track rollers, see page 68
- guideways, see page 76
- accessories, see page 106.

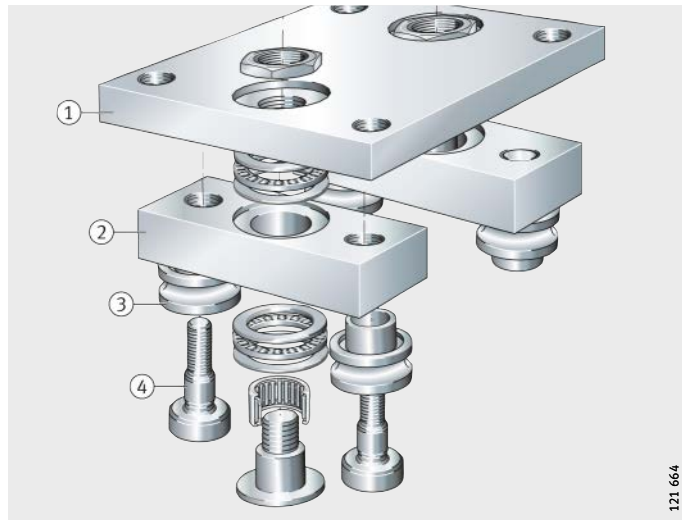
Track roller guidance systems

Track roller guidance system with bogie carriage

Bogie carriages LFDL..-B and LFDL..-SF can be used in combination with curved guideway elements LFSR..-ST to achieve almost any variant of oval and circular track guidance systems. The straight guideway elements are precisely matched to the arc.

The carriages LFDL..-B and LFDL..-SF comprise a steel carriage plate, two aluminium swivel brackets (supported axially and radially by rolling bearings). In the case of LFDL..-B, the preload of the four profiled track rollers can be set by means of two concentric and two eccentric bolts. In the case of LFDL..-SF, the preload is already preset to the optimum value by means of four concentric bolts, *Figure 5*.

LFDL..-SF cannot be mounted on closed curved guideway systems.



① Carriage plate
② Bracket
③ Track roller
④ Concentric bolt

Figure 5
Bogie carriage

Sealing and lubrication

The track rollers have gap seals on both sides, are greased for life and are therefore maintenance-free.

The contact zone between the raceways and track rollers must be lubricated via the shaft.

Corrosion-resistant design

All steel parts, the inner and outer rings of the track rollers and the bolts, washers and nuts are made from corrosion-resistant steel. The rolling elements are protected against corrosion by the grease.

Corrosion-resistant designs have the suffix RB (available by agreement only).

The adjustable carriage LFDL..-B must be used in combination with a 360° guideway.

Further information

Further information is given on the following pages:

- dimension table, see page 64
- track rollers, see page 68
- guideways, see page 76
- accessories, see page 106.

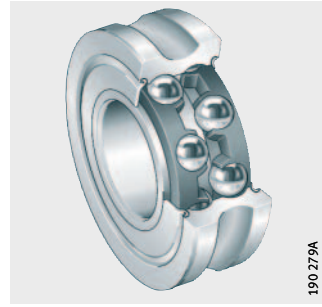
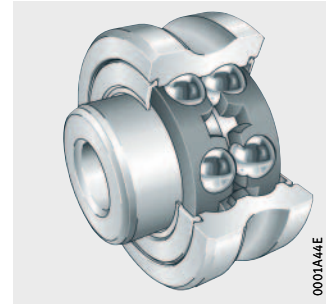
LFR

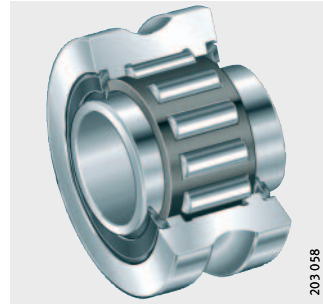


LFRI

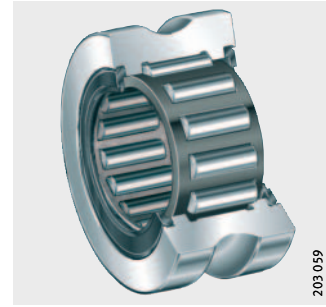


Non-locating bearing track roller

LFR..-2RSR-NA



LFR..-2RSR-RNA



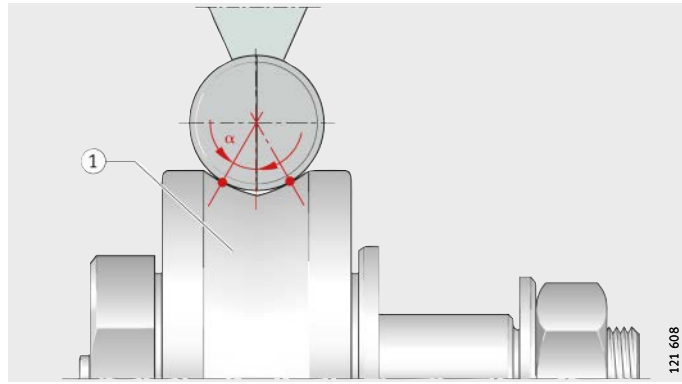
Track rollers

Features

Track rollers LFR are double row angular contact ball bearings comprising an outer ring with a gothic arch profile, an inner ring and two ball and cage assemblies with plastic cages. The inner ring and outer ring are made from rolling bearing steel 100Cr6.

The special outer ring gives two point contact in the contact zone with the raceway, *Figure 1*. The contact angle α is a maximum of 30°.

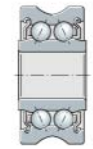
The bearings can support axial forces from both directions as well as radial forces.



α = 30°

① Gothic arch raceway groove

Figure 1
Gothic arch, two point contact, contact angle



Track roller with extended inner ring

Track rollers LFRI are double row angular contact ball bearings. They differ from track rollers LFR in that they have an extended inner ring. This allows exact positioning in the adjacent construction. The inner ring is mounted by means of a standard screw (for example ISO 4762) in a fit hole (preferably grade F6). The fixing screw is not included in the scope of delivery. The operating clearance of track rollers with an extended inner ring cannot be set by means of eccentric bolts.

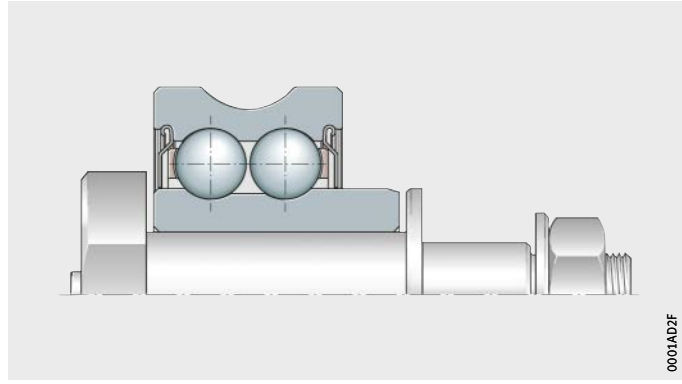


Figure 2
Track roller LFRI with fixing screw

Track rollers

Sealing and lubrication

Gap seals on both sides protect the rolling element system against contamination. Bearings with this seal type have the suffix 2Z.

The track rollers are also available on request with contact seals on both sides, suffix 2RS and 2RSR.

The track rollers are greased for life and are therefore maintenance-free. From outside diameter ≧ 52 mm, the inner ring has a lubrication bore.

Seal types

Seal types and their specific features: see table.

Specific features

2Z seal	
	Gap seal: ■ not radially preloaded ■ low friction ■ to be used with low levels of contamination
2RSR seal	
	Contact seal: ■ radially preloaded ■ to be used with higher requirements for sealing action and under heavy contamination
2RS seal	
	Contact seal: ■ axially preloaded ■ to be used with higher requirements for sealing action and under heavy contamination

Corrosion-resistant design

The inner ring and outer ring are made from corrosion-resistant steel. The rolling elements are protected against corrosion by the grease.

Corrosion-resistant designs have contact seals and the suffix 2RS-RB or 2RSR-RB.

Accuracy and internal clearance

The dimensional and geometrical accuracies correspond to tolerance class PN to DIN 620.

The radial internal bearing clearance corresponds approximately to internal clearance group Group N in accordance with ISO 5753-1; internal clearance classes: see Catalogue HR 1, Rolling Bearings.

Further information

Further information is given on the following pages:

- dimension tables, see page 90 and page 91
- bolts, see page 73
- guideways, see page 76
- accessories, see page 106.

Possible combinations of track rollers and guideways

The tables show the possible combinations of track rollers with the guideways LFS and shaft and support rail unit TS.

Track rollers

Design and safety guidelines

Adjacent construction for non-locating bearing track rollers

For non-locating bearing track rollers without an inner ring, the rolling element raceway on the shaft must be hardened and ground. The surface hardness must be 670 HV + 170 HV. The hardening depth CHD or SHD must be sufficiently large.

Design of the shaft: see table.

Tolerances and surface data for the shaft raceway

Diameter tolerance of shafts		Roughness	Roundness	Parallelism
without inner ring	with inner ring	max.	max.	max.
k5	g6 (under point load)	Ra 0,4 (Rz 2)	25% of diameter tolerance	50% of diameter tolerance

Bolts

Features

The bolts, which are made from high strength screw steel, are available with a concentric and eccentric collar; designation LFZ or LFE. Depending on their intended purpose, they are supplied with a washer, nut, drive fit lubrication nipple and sealing cap, see table.

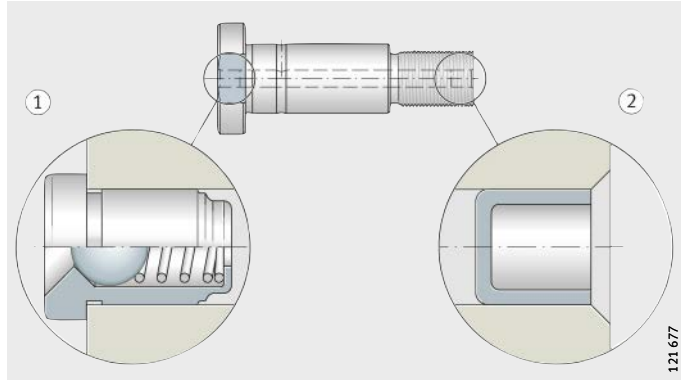
The eccentric designs LFE and LFE..-A1 allow the track roller guidance systems to be set clearance-free.

Delivered condition

Designation and suffix	Scope of delivery	Design
LFZ	Concentric bolt with washer	Standard
LFE	Eccentric bolt with washer and nut	Standard
LFZ..-A1 LFE..-A1	Concentric or eccentric bolt with washer and nut, drive fit lubrication nipple and sealing cap	Standard
NIP-A2	Drive fit lubrication nipple	Accessory
VD2	Sealing cap	Accessory

Lubrication

Bolts LFZ..-A1 and LFE..-A1 (from size 20) have a lubrication hole. Track rollers of outside diameter ≧ 52 mm can be lubricated via this hole. A lubrication nipple NIP-A2 can be pressed into the hole, *Figure 1*. If the hole will not be used for relubrication, it must be closed off using the sealing cap VD2.



① Drive fit lubrication nipple NIP-A2
② Sealing cap VD2

Figure 1
Drive fit lubrication nipple and sealing cap

Corrosion-resistant design

In this case, the bolts, washers and nuts are made from corrosion-resistant steel. These designs have the suffix RB.

Further information

Further information is given on the following pages:

- dimension tables, see page 84
- track rollers, see page 68
- guideways, see page 76
- accessories, see page 106.

Guideways

Features

Guideway designs: see table.

Designs

Guideway	Design
LFS 	■ With solid profile for location from above through holes
LFS..-C 	■ With hollow section profile (low mass) ■ Location from above through holes ■ The end faces of the hollow sections are closed off using plastic end covers
LFS..-F 	■ Flat guideway ■ Preferably for applications with stationary carriage and moving guideway ■ Location from above through holes
LFS..-M 	■ With support rail giving high bending rigidity ■ The guideway can be incorporated in modular constructions by means of slots. The slots are designed for nuts to DIN EN ISO 4032 and T-nuts to DIN 508 ■ The hollow sections are closed off using plastic end covers. Special plastic end covers are available for the slot closing strips
LFSR 	■ Curved guideway element made from steel ■ Location from above through holes ■ Combinations of curved guideway elements or of curved guideway elements and straight guideways should be treated in the same way as multi-piece guideways and must **always be ordered together**

Designs
continued

Guideway	Design
LFS120 	■ Wide, low guideway ■ With recesses for toothed racks or toothed belts ■ Location from above through holes
LFS..-FH 	■ Flat guideway with only one shaft as raceway ■ Mainly for applications with increased support spacing ■ Location from above through holes
LFS32-N, LFS..-NZZ 	■ With T-slot for location from below ■ The upper slot in the guideways and the lateral slots are suitable for toothed racks or toothed belts ■ Supplied with special support washers for the fixing screws; the quantity is based on the length of the guideway
TSN 	■ Composite guideway, aluminium support rail with screw mounted raceway shaft ■ Location from above ■ See Catalogue WF 1, Shaft Guidance Systems

Guideways without fixing holes

All LFS guidances with the exception of LFSR are also available without fixing holes; suffix OL.

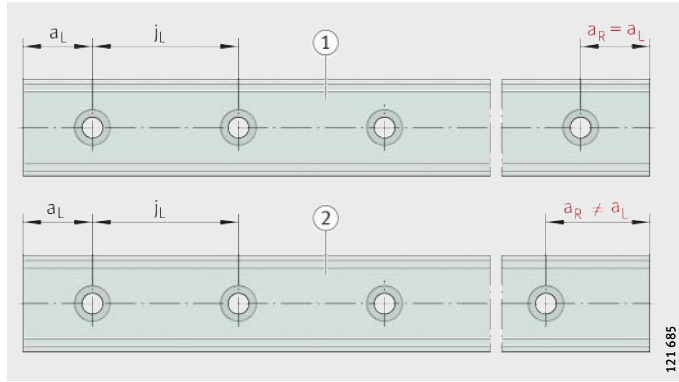
Guideways

Design and safety guidelines

Guideway hole patterns

Unless specified otherwise, guideways have a symmetrical hole pattern, *Figure 1*.

Upon request, an asymmetrical hole pattern may be available. In this case, $a_L \geqq a_{L\,min}$ and $a_R \geqq a_{R\,min}$.



① Symmetrical hole pattern
② Asymmetrical hole pattern

Figure 1
Hole patterns of guideways with one row of holes

Hole pitch values

The hole pitch values j_L are stated in the dimension tables. For high loads, guideways are available with reduced hole pitch values j_L, *Figure 2*.

These guideways have the suffix E or EE; examples: LFS..-E, LFS..-EE.

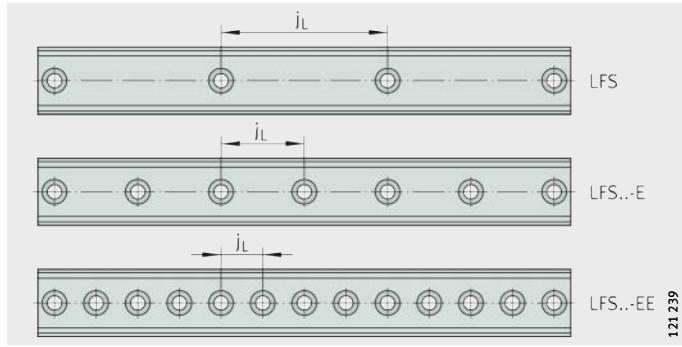


Figure 2
Hole spacings j_L

Maximum number of pitches between holes

The number of pitches between holes is the rounded down whole number equivalent to:

$$n = \frac{l - 2 \cdot a_{L\,min}}{j_L}$$

The spacings a_L and a_R are generally determined as follows:

$$a_L + a_R = l - n \cdot j_L$$

For guideways with a symmetrical hole pattern:

$$a_L = a_R = \frac{1}{2} \cdot (l - n \cdot j_L)$$

Number of holes:

$$x = n + 1$$

n –
Maximum possible number of pitches between holes

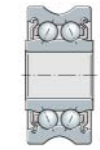
l mm
Guideway length

$a_{L\,min}$, $a_{R\,min}$ mm
Minimum values for a_L, a_R, see dimension tables

j_L mm
Spacing between holes

a_L, a_R mm
Spacing between start or end of guideway and nearest hole

x –
Number of holes.



If the minimum values for a_L and a_R are not observed, the counterbores of the holes may be intersected.

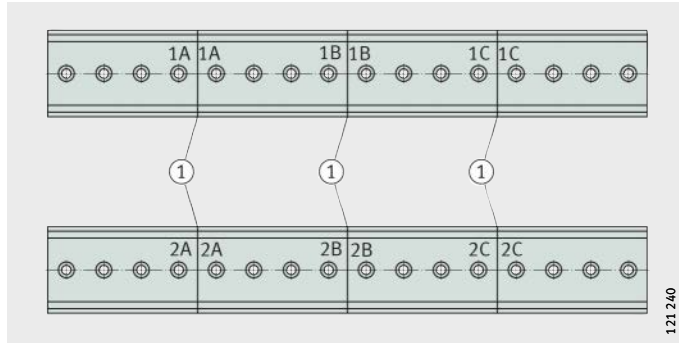
Guideways

Guideways without holes

All guideways LFS are also available without holes, with the exception of LFSR. These guideways have the suffix OL, for example LFS..-OL.

Multi-piece guideways

If the guideway length required is greater than l_{max}, the guideways are assembled from two or more sections matched to each other and marked accordingly. The sections may be of different lengths.
The guideway joint is always arranged centrally between the fixing holes, *Figure 3*.



① Marked joints

Figure 3
Multi-piece guideways

Accuracy of joint position

In order to achieve accuracy of the joint position, additional fixing is recommended for guideways from size 32 if the spacing C7 is larger than the stated limit value, see table and *Figure 4*, page 83.

In these cases, the guideways are supplied with the additional fixing hole already made.

Spacings for additional hole

Guideway	Spacing between hole and end of guideway	
	C7 Limit value mm	C8 Limit value mm
LFS32 (-C, -F)	30	11
LFS42-C	50	17
LFS52 (-C, -F)	50	17
LFS86-C	50	17
LFS120	50	17

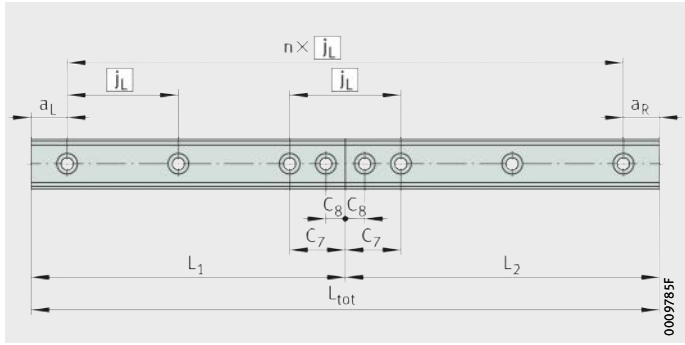


Figure 4
Additional hole

Two guideways LFS can have a deviation relative to each other at the joint position of:

- $\Delta b = \pm 0{,}01$ mm
- $\Delta h_4 = \pm 0{,}05$ mm, *Figure 5*.

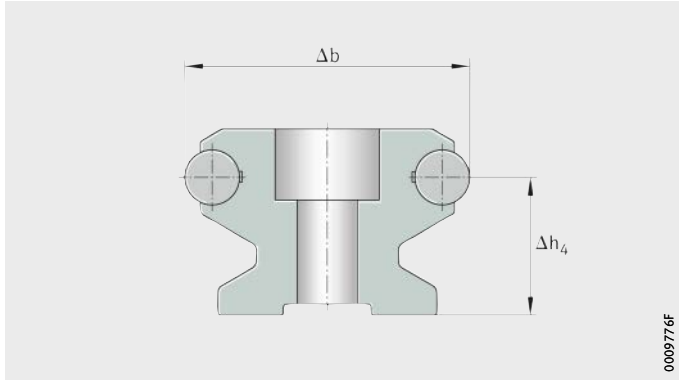

Figure 5
Deviation at the joint position on guideways assembled from sections

Guideways of corrosion-resistant design: LFS..-RB, observe note on page 18.

Modulus of elasticity for LFS..-C (-CE, -CEE, -E, -EE, -F, -FE): 72 000 N/mm^2.

Guideways LFS, LFS..-C and LFS..-F available without holes: LFS..-OL (-C-OL, -F-OL).

① Underside marked

1) Maximum length of single-piece guideways; longer guideways are supplied in several sections and are marked accordingly. Observe the length tolerances, see page 30.

2) a_L and a_R are dependent on the guideway length l_{max}, calculation: see page 80.

3) Under maximum load F_z and F_{0z}, support washers to DIN 433 and the maximum tightening torque according to the table, page 29, are required.

4) The design of the hollow sections is dependent on the size.

5) Counterbore depth for screws to DIN 7984.

6) If support washers to DIN 433 are used, screws to DIN 7984 are recommended.

Attention!
If curved guideway elements are required in combination with straight guideway sections, these must always be ordered together as a unit.
Closed oval tracks can only be ordered as a single unit.
A unit consists of two curved guideway elements LFSR with an arc dimension 180° and two straight guideways LFS or a unit of four curved guideways LFSR with an arc dimension 90° and four straight guideways LFS.
Note the guidelines relating to mounting of curved guideway elements, see page 27.

1) Maximum length of single-piece guideways.

2) For screw to DIN ISO 4762-8.8.

3) Number of holes on the pitch circle r_1.

Features

Guideway connector for guideways

Guideway connectors VBS are accessories for curved and straight LFS guideways.

They comprise:

- pins
- bushes
- grub screws.

The guideway connectors are suitable for all LF guideways. Joined curved guideways are supplied as standard with the guideway connector. Joined straight guideways are available as an option with the guideway connector.

The VBS reduces running noise at the joint, ensures an increased operating life for the guidance system and improves the operational reliability.

End plate

End plates ANS.LFS (also for use with hollow section guideways) are made from steel. They secure the rolled-in raceway shafts by means of form fit. In the case of solid section guideways, holes must be made in the end faces (by the customer) for screw mounting of the end plates.

The end plates prevent the shaft creep that can occur under unfavourable conditions on all guideways that comprise an aluminium support rail into which a steel shaft is rolled or pressed.

These can be supplied already fitted, but this must be indicated when ordering.

Lubrication and wiper units

Design AB.W

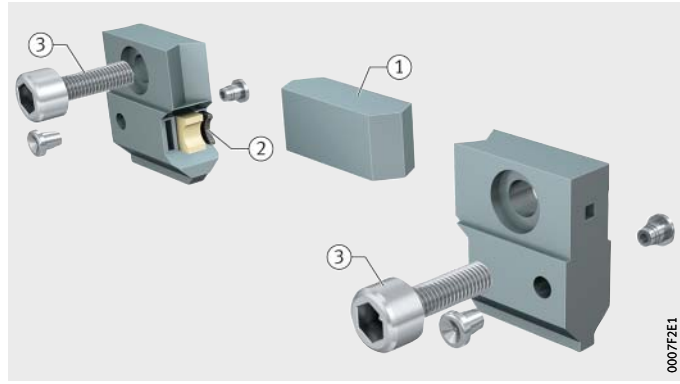
The lubrication and wiper unit AB.W comprises a plastic housing and is fixed to the adjacent construction. It contains a felt lubrication insert. This is supplied soaked with oil that has H1 approval and can be replenished with oil via a hole in the housing if necessary.

Lubrication and wiper units AB.W are supplied with fixing screws.

Design AB

The lubrication and wiper unit AB comprises a plastic housing and is screw mounted to the end of the carriage LFL-SF or LFDL. It contains felt lubrication inserts on both sides. These are supplied soaked with oil that has H1 approval and can be replenished with oil via lubrication nipples if necessary. The lubrication and wiper units AB can be fixed to carriages using two screws.

If the lubrication and wiper unit AB is used together with a stop PAH or PASTP, the central section must be removed, see *Figure 1*.



① Central section, supplied loose
② Felt lubrication inserts
③ Fixing screws, supplied loose

Figure 1
Lubrication and wiper unit AB

Accessories

Cap wipers

The cap wipers comprise a plastic housing and are slid over the track roller from below. They contains felt lubrication inserts on both sides. These are supplied soaked with oil that has H1 approval and can be replenished with oil via lubrication nipples if necessary.

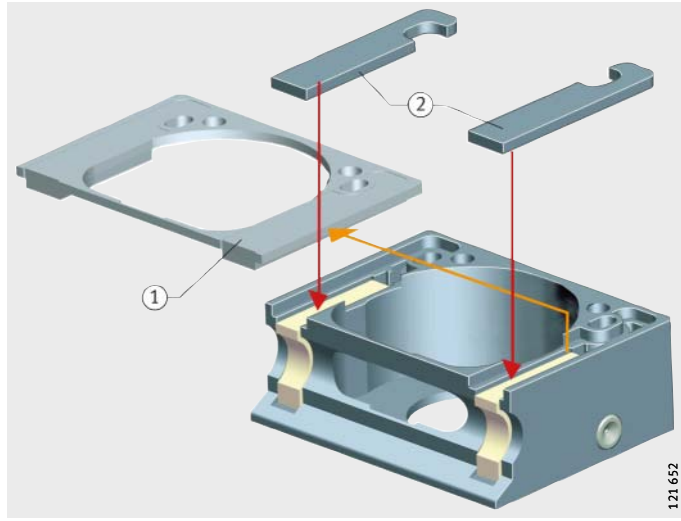
The cap wipers can be fixed using two screws to the screw mounting channels in the carriage LFCL and thus seal the track rollers from below at the screw head. When bolts LFZ and LFE are used in an application design, this gives a gap.

Cap wipers are supplied with fixing screws.

Design AB.LFR

If two or more AB.LFR are used per side, the displacement resistance can be reduced by removing the felt insert on the inner side.

AB.LFR are suitable for mounting on the carriage LFCL42 as well as customer designs. For mounting on the carriage LFCL42, the upper cover must be replaced by the two covers supplied, *Figure 2*.



① For mounting on the customer design
② For mounting on LFCL42

Figure 2
Mounting on carriage LFCL

Design AB.LFR5302

An exception is the cap wiper AB.LFR5302. This comprises an end cover and a relubrication and wiper unit AB.W10 that can be screw mounted to either the right or left of the end cover. Its function and location correspond to those of the other sizes.

Side plate

The side plate ABAL is made from plastic and can be screw mounted to the sides of carriages LFL..-SF. The side plates are used to supplement the lubrication and wiper units AB. The carriage can be sealed on all sides, with the exception of the underside, by means of two side plates and two lubrication and wiper units.

The side plate is supplied with fixing screws.

It can only be mounted in conjunction with the lubrication and wiper unit AB.

Stops

Design PAH

The stop PAH comprises anodised aluminium and a buffer made from shock-absorbent plastic. The stop can be placed at any position on guideways. It is then clamped in place by means of a screw.

The stop is used as an end stop or restricts the travel of the carriage.

The central section of lubrication and wiper units must be removed if the carriage is to run up against a stop PAH, see page 109.

Design PASTP

The stop PASTP is made from plastic. It can be screw mounted in a threaded hole (to be made by the customer) in guideways. This hole can be drilled at any position on guideways LFS. The stop is used as an end stop or restricts the travel of the carriage.

The central section of lubrication and wiper units must be removed if the carriage is to run up against a stop PASTP, see page 109.

End cover

End covers KA are made from plastic. The end covers close off the end faces of the hollow sections in guideways LFS..-C and LFS..-M as well as in the hollow section carriage LFCL.

Slot closing strip

Slot closing strips NAD are made from plastic. They close off the slots in the guideway LFS..-M. For information on NAD, see publication AL 1, Driven Linear Units.

Accessories

Fasteners

Fixing brackets, fixing lugs

For location of LFS-M with the integral profiled aluminium support rail, fixing brackets and fixing lugs are available, *Figure 3*, *Figure 4*, *Figure 5* and table, page 113.
